

Easier to use and costs less than individual emitters- 100' roll now only \$34 (6" spacing) or \$24 (12" spacing)

Great for container plants, too!

Installation Example

Left

Newly planted perennial bed showing 1/2" supply line and 1/4" emitter line with one half gph emitters every 6". Note emitterline spirals around roses to provide extra water to root zone.

Right-6 months later

Unretouched photo showing vigorous weed-free growth.

Below

Each run from the supply line is terminated by a goof plug and held down with staples. Tubing will disappear as plants grow or can be hidden by mulch. Mulch helps retain moisture.
